'Micromastery is a triumph. A brilliant idea, utterly convincing, and superbly carried through' - Philip Pullman

We know that we must be passionate about only one thing, that 10,000 hours of hard practice is needed to achieve mastery. In fact most successful people, including Nobel prize winners, nurture multiple areas of knowledge and activity that revolve around their central subject. Whether it's making a perfect soufflé, dancing a tango or lighting a fire, when we take the time to cultivate small and quantifiable areas of expertise, we change everything. We become faster and more fearless. We spot more creative opportunities, improve our brain health and boost our happiness. We see knowledge itself differently. The skills acquired in painting a door flawlessly or growing delicious chillies will unexpectedly transform your life. So start small. Start specific. But start - and you'll be on the path to mastery.

Data Mining: Concepts and Techniques provides the concepts and techniques in processing gathered data or information which will be used in various applications. Specifically, it explains data mining and the tools used in discovering useful knowledge from the collected data. This book is referred as the knowledge discovery from data (KDD). It focuses on the feasibility, usefulness, effectiveness, and scalability of techniques of large data sets. After describing data mining, the 2nd edition explains the methods of knowing, preprocessing, processing, and warehousing data. It then presents information about data warehouses, online analytical processing (OLAP), and data cube technology. Then, the methods involving mining frequent patterns, associations, and correlations for large data sets are described. The book details the methods of data classification and introduces the concepts and methods for data clustering. The remaining chapters discuss outlier detection and the trends, applications, and research frontiers in data mining. This book is intended for Computer Science students, application developers, business professionals, and researchers who seek information on data mining. Presents dozens of algorithms and implementation examples, all in pseudo-code and suitable for use in real-world projects. Addresses advanced topics such as mining object-relational databases, spatial databases, multimedia databases, time-series databases, text databases, the World Wide Web, and applications in several fields. Provides a comprehensive, practical look at the concepts and techniques you need to get the most out of your data.

Intraspecific communication involves the activation of chemoreceptors and subsequent activation of different cell areas that coordinate the responses of the entire organism—ranging from behavioral modification to modulation of hormones release. Animals emit intraspecific chemical signals, often referred to as pheromones, to advertise their presence to members of the same species and to regulate interactions aimed at establishing and regulating social and reproductive bonds. In the last two decades, scientists have developed a greater understanding of the neural processing of these chemical signals. **Neurobiology of Chemical Communication** explores the role of the chemical senses in mediating intraspecific communication. Providing an up-to-date outline of the most recent advances in the field, it presents information from laboratory and wild species, ranging from invertebrates to vertebrates, from insects to humans. The book covers the structure, anatomy, electrophysiology, and molecular biology of pheromones. It discusses how chemical signals function on different mammalian and non-mammalian species and includes chapters on insects, *Drosophila*, honey bees, amphibians, mice, tigers, and cattle. It also explores the controversial topic of human pheromones. An essential resource for students and researchers in the field of pheromones, this is also an ideal resource for those working on behavioral phenotyping of animal models and persons interested in the biology/ecology of wild and domestic species.

interactions in general. Arranged in three parts, the text begins by reviewing techniques nowadays almost considered classical, such as affinity chromatography and ultrafiltration, as well as the latest techniques. The second part focuses on all MS-based methods for the study of interactions of proteins with all classes of biomolecules. Besides pull-down approaches, this section also emphasizes the use of ion mobility MS, capture-compound approaches, chemical proteomics and interactomics. The third and final part discusses other important technologies frequently employed in interaction studies, such as biosensors and microarrays. For pharmaceutical, analytical, protein, environmental and biochemical research, as well as those working in pharmaceutical and analytical laboratories.
