Offers information required by pathology courses around the world. This title places emphasis on molecular pathology and genetics in the pathogenesis of various diseases, and the pathological discussions of each organ or system is preceded with a short description of its structure and function.

Immune-mediated neurological disorders present an increasing challenge to neurologists. Recent advances have identified new antibodies, new effector mechanisms and new diagnostic tests; these have greatly enhanced our understanding of disease aetiology and opened up therapeutic opportunities, but a critical understanding of this fast-developing field is not easy to find. This volume was conceived following a very successful course on neuroimmunology in Bergamo in 2000, and was written mainly by clinicians who are active in the laboratory. It will help to keep practising neurologists and neuroimmunologists abreast of the most recent developments, and to assess new information more critically. Angela Vincent and Gianvito Martino should be congratulated on masterminding this timely and practical text. July 2001 J. Margaret Stark and a team of authoritative experts offer a timely survey of the fundamental principles and latest developments in clinical forensic medicine. Topics range from sexual assault examination to injury interpretation, from nonaccidental injury in children, to crowd control agents. Also included are extensive discussions of the care of detainees, the management of substance abuse detainees in custody, the causes and prevention of deaths in custody, and the fundamentals of traffic medicine. In the absence of international standards of training, the authors also address the basic issues of consent, confidentiality, note-keeping, court reporting, and attendance in court. Comprehensive and authoritative, A Physicians Guide to Clinical Forensic Medicine offers forensic specialists and allied professionals a reliable, up-to-date guide to proven practices and procedures for a every variety of police inquiry requiring clinical forensic investigation.

The practice of forensic pathology includes the collection and analysis of evidence in relation to a corpse in order to establish the cause of death. Knowledge of the cause of death contributes to the determination of the manner of death by medical examiners and coroners, who are occasionally assisted by law enforcement officers. In the process of establishing the cause and manner of death, representatives of various investigative bodies have several responsibilities, including explaining the death to family members, attempting to reduce the risk of similar deaths in the future, and, if applicable, apprehending the individuals who are responsible for the death. The most well-known and popular role of a forensic pathologist is in the

investigation of cases of suspicious death; however, most medicolegal autopsies involve unexpected deaths that are above suspicion, many of which are caused by trauma (trauma being defined as any physical force or agent that causes bodily harm). The purpose of Forensic Pathology of Trauma: Common Problems for the Pathologist is to provide practical advice and information about the conduct of the forensic autopsy in cases of trauma, and to offer guidance about the analysis of the autopsy findings in these cases.

This book describes a novel and proven approach to cytologically classify urinary samples for the detection of bladder cancer and lesions of the upper urinary tract. The new method is based on the collective experience of knowledgeable cytopathologists who have tested the terminology within their own laboratories for reproducibility and predictability of neoplasms of the urinary tract. Accompanying the written criteria for each diagnostic category are meticulously photographed exemplars of the cellular features, with cogently annotated descriptions of the photographs. The book thereby performs as an atlas for microscopists involved in diagnostic cytopathology at all levels of their education. Included in the targeted readership are experienced pathologists, cytotechnologists, and students of both professional groups. The new terminology also considers the clinical aspects of patient management. Written by experts in the field who convened at the 18th International Congress of Cytology in Paris, The Paris System for Reporting Urinary Cytology presents a global standard for reporting and a new philosophic approach that maximizes the strengths of detecting the potentially lethal high grade lesions by urinary cytology, and recognizes without apology the inability to reliably detect the low grade lesions in urinary cytology. The Concept has been endorsed by the American Society Of Cytopathology, and the International Academy of Cytology.

The field of microbiology has developed considerably in the last 20 years, building exponentially on its own discoveries and growing to encompass many other disciplines. Unfortunately, the literature in the field tends to be either encyclopedic in scope or presented as a textbook and oriented for the student. Finding its niche between these two poles

This manual provides an authoritative guide to standard laboratory procedures for detecting and diagnosing sexually transmitted diseases. Addressed to clinical microbiologists and medical technologists, the manual is designed to serve as a practical bench aid, tuned to the needs and capacities of laboratories at different levels in the health system. Although the standard procedures described have universal relevance, particular attention is given to conditions in developing countries, where rapid transport of specimens may not be possible and cost factors may be decisive. Recommended procedures, tests, and techniques are supported by close to 150 references. Noting the constraints on staff and resources faced by most laboratories throughout the world, the manual concentrates on tests known to yield essential diagnostic information. Standard antimicrobial susceptibility tests are described for those diseases where drug resistance is a problem. Although the major emphasis is on procedures for diagnosis, case-finding, and test-of-cure, some procedures useful in epidemiological research are also included. The manual has nine chapters covering the full range of sexually transmitted diseases: gonorrhoea, Chlamydia trachomatis infection, syphilis, genital herpes, chancroid, granuloma inguinale, vaginitis in adults, human papillomavirus infection, and human immunodeficiency virus. Each chapter opens with a brief description of the disease and the principal laboratory approaches to diagnosis, followed by detailed advice on the collection and transport of specimens. Against this background, all relevant laboratory methods, from microscopy, culture and non-culture techniques to serology and the use of commercial test kits, are described in detail, with colour plates used to illustrate selected procedures and results. Apart from providing detailed step-by-step instructions for each procedure, the manual offers abundant practical advice on the selection of tests, their comparative sensitivity, and specificity, the degree of skill required, the correct interpretation of results, and common errors and how to avoid them. The chapter on HIV infection reproduces the latest joint UNAIDS and WHO recommendations for the selection and use of HIV antibody tests. Further practical guidance for each of these diseases is provided in three annexes, which summarize appropriate diagnostic tests at different levels of the laboratory system, describe the media, reagents, and stains required for the tests, and list all the basic products needed to prepare essential reagents and media.

This book provides information on immunology, which is a branch of biomedical sciences to study the immune system physiology in both diseased and healthy states. Some aspects of autoimmunity enable us to understand that it is not always related to pathology. For example, autoimmune reactions are effective in clearing off the unwanted, excess or aged tissues from the body. Also, autoimmunity occurs after the exposure to the non-self-antigen which is structurally similar to the self, assisted by the stimulatory molecules such as cytokines. Therefore, it can be said that there's a minor difference between immunity and auto-immunity. The question of how physiologic immunity changes to pathologic autoimmunity continues to interest researchers. Answer to such questions can be found by understanding physiology of the immune system. This book covers various topics organized under two sections: Nutrition & Immunology and Parasite Immunology. The contributors of this book have carefully selected topics which would be of reader's interests.
