Atlas of the Pig Gut
Poultry and pig nutrition: challenges of the 21st century focuses on the important challenges animal production faces in the light of increasing global feed scarcity, climate change and improvements in animal welfare. Animal nutrition plays a critical role in providing answers to these 21st century challenges. Internationally leading authorities in nutrition and nutrition-related disciplines provide their views and solutions. New research areas are discussed and the current gaps in our knowledge are identified. Among the topics discussed are the use of microbes for natural solutions, the importance of individual feed intake determination, technological treatments of feed ingredients, and advances in modelling. In addition, authors provide their insights on the effects of environment/housing on animal functioning and the impact of climate change on the mycotoxin content of feed ingredients as well as the importance of pro- and antioxidant balance in animals. The increasing global demand for feed will increase the search for alternative feed ingredients especially new protein sources while for an environmentally sustainable human diet, life cycle assessment needs to be combined with other modelling techniques that address environmental impacts of dietary choices at the (inter)national level. Future challenges require new solutions and innovations, and this book contains a collection of ideas for our 21st century challenges.

Zoonoses and Communicable Diseases Common to Man and Animals African swine fever, classical swine fever, pseudorabies, influenza A virus in swine, etc. are some of the common swine diseases. Classical swine fever (CSF) is a highly contagious disease of swine that causes skin lesions, fever and convulsions, and ultimately culminates in death. Artificial immunization procedures can confer immunity against this condition. Diagnostic tests, such as direct and indirect immunofluorescence, ELISA and histology of the brain can be used to detect the disease. Swine vesicular disease (SVD) is another acute and contagious viral disease that is caused by the swine vesicular disease virus. It is typically characterized by fever, ulcers in the mouth and snout, feet and teats. This disease can infect pigs by exposure to feed containing lethal meal scraps, or infected fecal matter. Since no vaccine exists for this condition, various eradication measures are adopted such as quarantining infected areas, disposal and depopulation of infected pigs and disinfecting contaminated premises. This book covers in detail some existing theories and innovative concepts revolving around swine health. Some of the diverse topics covered in this book address the varied swine diseases that fall under this category. It is a vital tool for all researching or studying swine diseases as it gives incredible insights into emerging trends and concepts.

Mycoplasma Diseases of Ruminants An overview of farm-to-fork safety in the preharvest realm Foodborne outbreaks continue to take lives and harm economies, making controlling the entry of pathogens into the food supply a priority. Preharvest factors have been the cause of numerous outbreaks, including *Listeria* in melons, *Salmonella* associated with tomatoes, and Shiga toxin-producing *E. coli* in beef products, yet most traditional control measures and regulations occur at the postharvest stage. Preharvest Food Safety covers a broad swath of knowledge surrounding topics of safety at the preharvest and harvest stages, focusing on problems for specific food sources and food pathogens, as well as new tools and potential solutions. Led by editors Siddhartha Thakur and Kalmia Kniel, a team of expert authors provides insights into critical themes surrounding preharvest food safety, including Challenges specific to meat, seafood, dairy, egg, produce, grain, and nut production Established and emerging foodborne and agriculture-related pathogens Influences of external factors such as climate change and the growing local-foods trend Regulatory issues from both US and EU perspectives Use of pre- and probiotics, molecular tools, mathematical modeling, and one health approaches Intended to encourage the scientific community and food industry stakeholders to advance their knowledge of the developments and challenges associated with preharvest food safety, this book addresses the current state of the field and provides a diverse array of chapters focused on a variety of food commodities and microbiological hazards.

Veterinary Medicine - E-BOOK Goats are adaptable creatures in the wild but, if kept as pets, or commercially farmed, they rely very heavily on their owners not only for food, water and shelter, but also for protection from disease or injury. This second edition has been extensively updated to include more information on current issues such as antimicrobial and anthelmintic resistance, herd health planning, and new and emerging or changing conditions such as bovine TB. It is a clearly written, well-illustrated book and should be an invaluable, practical reference work aimed at all those who own, or care for, goats whether they be commercial goat farmers, smallholders, stock people, veterinary surgeons and students. It is written by an experienced veterinary surgeon, and its overall objective is to provide some practical advice on managing goats daily including tips on how to keep them fit and healthy, how to recognise signs of ill health, and when a veterinary surgeon needs to be consulted.

Veterinary Medicine The emergence of severe acute respiratory syndrome (SARS) in late 2002 and 2003 challenged the global public health community to confront a novel epidemic that spread rapidly from its origins in southern China until it had reached more than 25 other countries within a matter of months. In addition to the number of patients infected with the SARS virus, the disease had profound economic and political repercussions in many of the affected regions. Recent reports of isolated new SARS cases and a fear that the disease could reemerge and spread have put public health officials on high

alert for any indications of possible new outbreaks. This report examines the response to SARS by public health systems in individual countries, the biology of the SARS coronavirus and related coronaviruses in animals, the economic and political fallout of the SARS epidemic, quarantine law and other public health measures that apply to combating infectious diseases, and the role of international organizations and scientific cooperation in halting the spread of SARS. The report provides an illuminating survey of findings from the epidemic, along with an assessment of what might be needed in order to contain any future outbreaks of SARS or other emerging infections.

Livestock's Long Shadow Written in response to a growing demand on the part of pig farmers, here is a text-book which will provide a working manual to which reference can be readily made. Not all the diseases discussed in the text are of interest to pig producers in the United Kingdom but they have been included in the hope that they may be of interest to pig farmers in other countries. Also some of the diseases discussed are subject to the restrictions under the Diseases of Animals Acts and Orders, but they have been included in the hope that owners may recognise the cardinal symptoms of these diseases and take action accordingly.

Veterinary Technician's Daily Reference Guide Mycoplasmas are the smallest of free-living organisms and are intermediate between viruses and bacteria. Many species thrive as parasites in animal (including human) hosts. This book is based on proceedings of a conference held in Palermo, Italy. It reviews some of the most important mycoplasma diseases of sheep, goats and cattle including contagious bovine pleuropneumonia, contagious agalactia and calf pneumonia, which are listed by the OIE because of their economic implications.

Diseases of Swine Provides an overview of the current knowledge of polymicrobial diseases of multiple etiologic agents in both animals and humans. Explores the contribution to disease made by interacting and mutually reinforcing pathogens, which may involve bacteria, viruses, or parasites interacting with each other or bacteria interacting with fungi and viruses. Emphasis on identifying polymicrobial diseases, understanding the complex etiology of these diseases, recognizing difficulties in establishing methods for their study, identifying mechanisms of pathogenesis, and assessing appropriate methods of treatments.

Intestinal health The first edition of this book was written as student notes, but demand from veterinarians, veterinary students and farmers led to its publication. It is intended primarily to describe diseases of pigs present in the UK and Europe, those that threaten the European pig industry or those which may yet be identified here. It deals mainly with conditions found in intensive units and can therefore be used worldwide. Conditions which are uncommon in such intensive units may be dealt with in less detail. The descriptions of diseases and the measures adopted for their control are based on a mixture of personal experience, review of the literature and, in the case of the newer syndromes, word of mouth or case reports. This edition reflects the increasing concern of the veterinary profession and public in the UK about welfare, meat quality and general safety. The account of each disease is supplemented with an opinion on the humane endpoint for slaughter, and on risks to humans to be expected from each disease and therapy.

Emerging Swine Viruses This book gives a comprehensive overview of recent trends in infectious diseases, as well as general concepts of infections, immunopathology, diagnosis, treatment, epidemiology and etiology to current clinical recommendations in management of infectious diseases, highlighting the ongoing issues, recent advances, with future directions in diagnostic approaches and therapeutic strategies. The book focuses on various aspects and properties of infectious diseases whose deep understanding is very important for safeguarding human race from more loss of resources and economies due to pathogens.

Spillover: Animal Infections and the Next Human Pandemic Livestock production is changing worldwide. Amongst the changes are those instigated by legislation such as restrictions on antibiotics and antibiotic growth promoters, well fare regulations, etc., all forcing livestock producers to adapt to new husbandry, management, nutrition and healthcare techniques. Food safety is an explosive political issue. The expectations and demands of the informed consumer have altered perceptions of risk and brought food safety to the very front and centre of politics. The gastrointestinal tract is essential in the maintenance of health, wellbeing and production in livestock. The above changes impact feed formulation. The industry looks for alternatives to maintain intestinal health and maximise animal performance, whilst complying with increasingly stringent legislation. This requires a good understanding of the physiological processes involved. In this book, the current knowledge in the major monogastric production species (pigs and chicken) is reviewed by renowned experts in the field. It describes infectious and non-infectious challenges as well as the complex interaction between innate, cellular and humoral immunity and performance. The problems that this complexity poses concerning the identification of important factors for intestinal health are discussed. 'Intestinal health' also reviews promising new approaches such as the use and development of validated biomarkers, and the application of omics techniques and systems biology.
