Across all cultures parenting is the foundation of family life. It is the domain where adult mental health meets infant development. Beginning in pregnancy, parenting involves many conscious and unconscious processes which have recently been shown to affect a child's development significantly. This book focuses on pregnancy and the first year of life, providing a thorough account of the points of encounter between adult and infant psychiatry. In a fresh and comprehensive way, it summarises knowledge about early parenting, including a critical analysis of parenting, what it means to be a "good enough parent", and its relationship to infant, parent and family outcomes. In addition to the psychiatric dimension, the book emphasises the biological aspects of parenting, parental psychopathology and normal and abnormal infant development. Praise for Parenting and Mental Health: "Tyano, Keren, Herrman and Cox have edited a thoughtfully prepared guide on normal and abnormal parenting. They have, with enormous skill and wisdom, helped to unite the important aspects of pregnancy, infant and childhood development and parenting for adult and child and adolescent psychiatrists. World-class internationally recognized clinicians and researchers help make this book useful throughout the world. This is a masterful, culturally sensitive and important book which provides a long overdue and much needed guide on relationships among children, parents and families." —Michelle Riba, M.D., M.S., Professor and Associate Chair for Integrated Medical and Psychiatric Services, Department of Psychiatry, University of Michigan, USA "During recent decades, progress in the field of infant mental health has been revolutionary; at the same time, there has been rapid development in women's mental health. By bringing these two together, this pioneering book leads its readers to the vital new focal point around perinatal mental health. The book integrates the origins of developmental psychiatry in attachment and systemic contexts and shows concretely how relationship experiences and biology interact when new life begins. After describing the fascinating world of early parenting, the book focuses on problems, difficulties and disorders during this phase of life and above all on how to support, intervene and treat disorders in parenting.

This report presents the recommendations of a WHO Expert Committee commissioned to coordinate activities leading to the adoption of international recommendations for the production and control of vaccines and other biological substances, and the establishment of international biological reference materials. Following a brief introduction, the report summarizes a number of general issues brought to the attention of the Committee. The next part of the report, of particular relevance to manufacturers and national regulatory authorities, outlines the discussions held on the development and adoption of new and revised WHO Recommendations, Guidelines, and guidance documents. Following these discussions, WHO Guidelines on the quality, safety and efficacy of Ebola vaccines, and WHO Guidelines on procedures and data requirements for changes to approved biotherapeutic products were adopted on the recommendation of the Committee. In addition, the following two WHO guidance documents on the WHO prequalification of in vitro diagnostic medical devices were also adopted: (a) Technical Specifications Series (TSS) for WHO Prequalification - Diagnostic Assessment: Human immunodeficiency virus (HIV) rapid diagnostic tests for professional use and/or self-testing; and (b) Technical Guidance Series (TGS) for WHO Prequalification - Diagnostic Assessment: Establishing stability of in vitro diagnostic medical devices. Subsequent sections of the report provide information on the current status, proposed development and establishment of international reference materials in the areas of: antibiotics, biotherapeutics other than blood products; blood products and related substances; in vitro diagnostics; and vaccines and related substances. A series of annexes are then presented which include an updated list of all WHO Recommendations, Guidelines, and other documents on biological substances used in medicine (Annex 1). The above four WHO documents adopted on the advice of the Committee are then published as part of this report (Annexes 2-5). Finally, all additions and discontinuations made during the 2017 meeting to the list of International Standards, Reference Reagents and Reference Panels for biological substances maintained by WHO are summarized in Annex 6. The updated full catalog of WHO International Reference Preparations is available at: <http://www.who.int/bloodproducts/catalogue/en/>.

The human immunodeficiency virus (HIV) is characterized by extremely high variability resulting in the emergence of widely divergent viral strains in diverse geographical locations and different populations. HIV strains can also vary significantly with regard to their biological and immunological properties, which may have important implications for clinical aspects of HIV infection, diagnostics, treatment, and the development of effective HIV vaccines. It is therefore important to develop appropriate laboratory technologies and capacities for systematic collection and detailed characterization of globally prevalent HIV-1 strains. This second edition contains the latest information and recommendations with regard to standard procedures for HIV isolation and its genetic, biological, and immunological characterization with a special emphasis on their applicability in HIV vaccine-related research. The laboratory methods described in these guidelines were intensively validated through various collaborative studies conducted in the framework of the WHO-UNAIDS Network for HIV Isolation and Characterization.

The thoroughly revised and updated Third Edition of the acclaimed Modern Epidemiology reflects both the conceptual development of this evolving science and the increasingly focal role that epidemiology plays in dealing with public health and medical problems. Coauthored by three leading epidemiologists, with sixteen additional contributors, this Third Edition is the most comprehensive and cohesive text on the principles and methods of epidemiologic research. The book covers a broad range of concepts and methods, such as basic measures of disease frequency and associations, study design, field methods, threats to validity, and assessing precision. It also covers advanced topics in data analysis such as Bayesian analysis, bias analysis, and hierarchical regression. Chapters examine specific areas of research such as disease surveillance, ecologic studies, social epidemiology, infectious disease epidemiology, genetic and molecular epidemiology, nutritional epidemiology, environmental epidemiology, reproductive epidemiology, and clinical epidemiology.

Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.
